Project Title

Student 1, Student 2, Student 3, Student 4

Project on GENI and any public link: Please specify the name of your GENI slice, and make sure your GENI resources are active by specifying an expiration date that is later than December 23, 2020. In case your project provides a web interface, please make sure your GENI node has a public routable IP address so it can be accessed.

1. Introduction / Problem Statement

Describe the problem in detail, outlining what are the learning outcomes of this experiment.

2. Experimental Methodology

This section should describe the experimental methodology, including architecture diagrams and descriptions of each component, along with assumptions (e.g. maximum number of requests your system can handle in parallel).

3. Results

3.1 Usage Instructions

Describe how one can interact with your experiment, i.e. web interface or command line [use screenshots]

3.2 Analysis

This section should contain the results of your experiment and their analysis. Please create graphs that show various aspects of performance or learning objectives.

4. Conclusion

This section should conclude your report with a summary of your main findings and possible extensions to the project.

5. Division of Labor

This section should describe the contribution of each group member.

Note: The project report should be no more than **4 pages, including figures, tables and references**. Your GitHub should include all the code and configuration files such as **Rspec files to reserve resources, and a working demo's video**, along with all the step-by-step instructions to reproduce the setup. You should also have automated scripts to download (using "wget") the required code to run on any GENI node or install any required package(s) on the node.
